ABSTRACT

The study investigated relationship of career beliefs with internet savviness, family environment, socio-economic status and career indecision. The main findings were: there is no significant relationship between career beliefs and internet savviness of the adolescents. There is significant and negative relationship between career beliefs and dimensions of family environment. There is significant and negative relationship between career beliefs and socio-economic status of adolescents. There is significant relationship between career beliefs and career indecision of adolescents. There is no significant difference between high and low internet savviness on career beliefs. There is no significant difference between positive and negative family environment on career beliefs. There is a significant difference between high and low socio-economic status on career beliefs. There is a significant difference between high and low career indecision on career beliefs. There is no significant first order and second order interaction between all the variables on career beliefs. There is a significant difference between institutional types on career beliefs. There is a significant difference between male and female on their career beliefs. Career indecision, socio-economic status, cohesion and social collaboration were all found to be the predictors of career beliefs and contribute significantly to career beliefs.
